

The impact of the mandible on facial aestheitcs and body posture

Abstract

The mandible, the most unique bilateral joint of the body, placed right at the top of the body has an incredible impact on the entire body. This presentation will deliver the Smylist concept of this impact in a completely rational and logical progression. These concepts have been introduced for the first time in the subject of dentistry by the speaker Dr. Maira Csillag. The lecture will present objective connections between facial easthetics and the mandibular positions. Also very stunning is the connection created between body postures and mandibular rotations to the left or right side or in an upwards direction. The presentation will demonstrate how rectifying the mandibular position instantaneously corrects the posture in a matter of minutes. It will conclude with how Smylist therapy impacts not just the teeth, but also the face, facial aesthetics and the entire body.
